

Fishery, joint reviewer: the target decides where the stock settles

R1 closed loop, 64 contexts per line (thin lines = single contexts, bold = median). The MSY target keeps 50 after each harvest, which regrows to about 68. The old line lets the stock be run down to just above 10. With no inspection, assuming every unseen request is the maximum held the stock near 37 by accident. Harvest = mean total over 80 steps.
