

S1 by context: the harm from trusting reports is broad, not a few outlier populations

Same arms as Figure 4, counted per context (the independent unit) instead of pooled over steps. 'max' = most unsafe executed steps in any one context; 'collapsed' = contexts where the stock collapsed before step 80. Full verification is the honest baseline: in Harvest the reviewer's 5% risk allowance still let an unsafe action through in 16 contexts (0.4% of steps, Figure 4).
