

S3: where audits plus fines deter, and how a predictable schedule fails (Fishery, MSY target)

64 held-out contexts; one cheating level per group chosen on 8 training contexts. Left: gain shown only while the group still cheats; after the switch the gain is 0. The curves overlap because, for a risk-neutral cheater facing a flat fine, only e matters (largely arithmetic). Right: fine 6 gives the same result as 24.
