

S4: cheaters who know the reviewer remembers (Fishery, MSY target)

64 held-out contexts; cheaters choose level and reaction to a catch on 8 training contexts (they always chose 'keep cheating at 0.75' or 'comply'). Memory alone cuts the gain (to 41% of the no-check gain at 1/3) but cannot remove it: in 98% of caught-cheater steps the targeted allowance was already 0, so a caught cheater still took more than planned [post hoc]. With memory, a fine deters at half the audit rate (0.05 instead of 0.10). Dotted lines only join tested rates.
